#### Conclusion

The MAX2369 successfully meets the quality and reliability standards required of all Maxim products. In addition, Maxim's continuous reliability monitoring program ensures that all outgoing product will continue to meet Maxim's quality and reliability standards.

## I. Device Description

#### A. General

The MAX2369 is a dual-band, triple-mode complete transmitter for cellular phones. The device takes a differential I/Q baseband input and mixes it up to IF through a quadrature modulator and IF variable-gain amplifier (VGA). The signal is then routed to an external bandpass filter and upconverted to RF through an SSB mixer and RF VGA. The signal is further amplified with an on-board PA driver.

The MAX2369 is designed for dual-band operation and supports TDMA for the PCS band as well as TDMA and AMPS for the cellular band. The desired mode of operation is selected by loading data on the SPI<sup>™</sup>/ MICROWIRE <sup>™</sup>-compatible 3-wire serial bus. The MAX2369 then routes the signals to the appropriate ports depending on which band is selected. The MAX2369 includes two RF LO input ports and two PA driver ports, eliminating the need for external switching circuitry.

The MAX2369 takes advantage of the serial bus to set modes such as charge-pump current, high or low sideband injection, and IF/RF gain balancing. It is packaged in a small (7mm 5 7mm) 48-pin QFN package with exposed paddle.

## II. Manufacturing Information

A. Description/Function: Complete Dual-Band Quadrature Transmitter

B. Process: GST2 – High Speed Double Poly-Silicon Bipolar Process

C. Number of Device Transistors: 10,195

D. Fabrication Location: Oregon, USA

E. Assembly Location: Korea

F. Date of Initial Production: January, 2001

# III. Packaging Information

A. Package Type: 48-Pin QFN-EP

B. Lead Frame: Copper

C. Lead Finish: Solder Plate

D. Die Attach: Silver-filled Epoxy

E. Bondwire: Gold (1.2 mil dia.)

F. Mold Material: Epoxy with silica filler

G. Assembly Diagram: # 05-2201-0042

H. Flammability Rating: Class UL94-V0

I. Classification of Moisture Sensitivity

per JEDEC standard JESD22-112: Level 3

#### IV. Die Information

A. Dimensions: 144 x 100 mils

B. Passivation: Si<sub>3</sub>N<sub>4</sub>/SiO<sub>2</sub> (Silicon nitride/ Silicon dioxide)

C. Interconnect: Poly / Au

D. Backside Metallization: None

E. Minimum Metal Width: 2 microns (as drawn)

F. Minimum Metal Spacing: 2 microns (as drawn)

G. Bondpad Dimensions: 5 mil. Sq.

H. Isolation Dielectric: SiO<sub>2</sub>

I. Die Separation Method: Wafer Saw

#### V. Quality Assurance Information

A. Quality Assurance Contacts: Jim Pedicord (Reliability Lab Manager)

Bryan Preeshl (Executive Director) Kenneth Huening (Vice President)

B. Outgoing Inspection Level: 0.1% for all electrical parameters guaranteed by the Datasheet.

0.1% For all Visual Defects.

C. Observed Outgoing Defect Rate: < 50 ppm

D. Sampling Plan: Mil-Std-105D

# VI. Reliability Evaluation

## A. Accelerated Life Test

The results of the 150°C biased (static) life test are shown in **Table 1**. Using these results, the Failure Rate ( $\lambda$ ) is calculated as follows:

$$\lambda = \underbrace{\frac{1}{\text{MTTF}}}_{} = \underbrace{\frac{1.83}{192 \text{ x } 9823 \text{ x } 45 \text{ x } 2}}_{} \text{(Chi square value for MTTF upper limit)}$$

$$\underline{\qquad \qquad }_{} \text{Temperature Acceleration factor assuming an activation energy of } 0.8eV$$

$$\lambda = 10.78 \times 10^{-9}$$

 $\lambda$  = 10.78 F.I.T. (60% confidence level @ 25°C)

This low failure rate represents data collected from Maxim's reliability monitor program. In addition to routine production Burn-In, Maxim pulls a sample from every fabrication process three times per week and subjects it to an extended Burn-In prior to shipment to ensure its reliability. The reliability control level for each lot to be shipped as standard product is 59 F.I.T. at a 60% confidence level, which equates to 3 failures in an 80 piece sample. Maxim performs failure analysis on any lot that exceeds this reliability control level. Maxim also performs quarterly 1000 hour life test monitors. This data is published in the Product Reliability Report (RR-B3A).

#### B. Moisture Resistance Tests

Maxim pulls pressure pot samples from every assembly process three times per week. Each lot sample must meet an LTPD = 20 or less before shipment as standard product. Additionally, the industry standard 85°C/85%RH testing is done per generic device/package family once a quarter.

#### C. E.S.D. and Latch-Up Testing

The WR33 die type has been found to have all pins able to withstand a transient pulse of  $\pm 600$ V, per Mil-Std-883 Method 3015 (reference attached ESD Test Circuit). Latch-Up testing has shown that this device withstands a current of  $\pm 250$ mA.

# Table 1 Reliability Evaluation Test Results

## MAX2369EGM

TEST ITEM	TEST CONDITION	FAILURE IDENTIFICATION	PACKAGE	SAMPLE SIZE	NUMBER OF FAILURES
Static Life Test	(Note 1)

#### Attachment #1

TABLE II. Pin combination to be tested. 1/2/

	Terminal A (Each pin individually connected to terminal A with the other floating)	Terminal B (The common combination of all like-named pins connected to terminal B)
1.	All pins except V <sub>PS1</sub> 3/	All V <sub>PS1</sub> pins
2.	All input and output pins	All other input-output pins

- 1/ Table II is restated in narrative form in 3.4 below.
- 2/ No connects are not to be tested.
- 3/ Repeat pin combination I for each named Power supply and for ground

(e.g., where  $V_{PS1}$  is  $V_{DD}$ ,  $V_{CC}$ ,  $V_{SS}$ ,  $V_{BB}$ , GND,  $+V_{S}$ ,  $-V_{S}$ ,  $V_{REF}$ , etc).

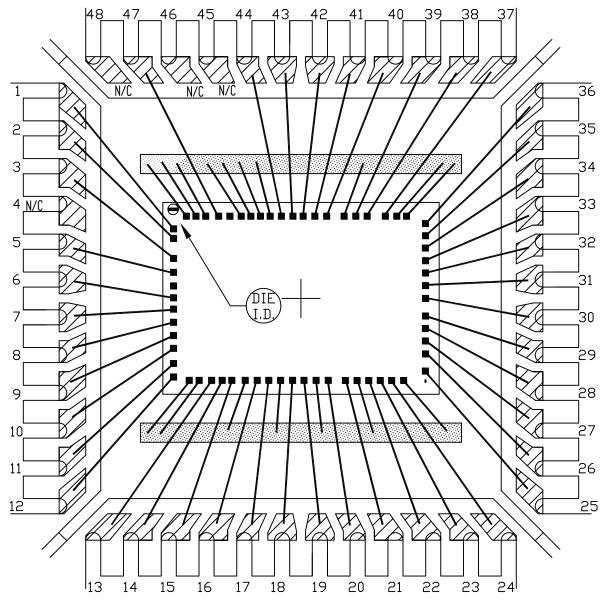

## 3.4 Pin combinations to be tested.

- a. Each pin individually connected to terminal A with respect to the device ground pin(s) connected to terminal B. All pins except the one being tested and the ground pin(s) shall be open.
- b. Each pin individually connected to terminal A with respect to each different set of a combination of all named power supply pins (e.g., \( \lambda\_{S1} \), or \( \lambda\_{S2} \) or \( \lambda\_{S3} \) or \( \lambda\_{CC1} \), or \( \lambda\_{CC2} \)) connected to terminal B. All pins except the one being tested and the power supply pin or set of pins shall be open.
- c. Each input and each output individually connected to terminal A with respect to a combination of all the other input and output pins connected to terminal B. All pins except the input or output pin being tested and the combination of all the other input and output pins shall be open.

Mil Std 883D Method 3015.7 Notice 8
