Keywords: 1-Wire Master, IEEE 1451.4, XML, configuration

# APPLICATION NOTE 2965 1-Wire Master Device Configuration

#### Mar 03, 2004

Abstract: The 'family code' embedded in the lasered read-only memory (ROM) number of each 1-Wire<sup>®</sup> device signifies a specific device type. Since each device type has different features and commands, it is imperative the 1-Wire master knows how to translate this family code into the correct commands. This document presents a method to dynamically configure the 1-Wire master to correctly communicate with a previously unknown 1-Wire device type by providing the 1-Wire master with an XML configuration file. This document was originally created to support the IEEE<sup>®</sup> 1451.4 A Smart Transducer Interface for Sensors and Actuators—Mixed-Mode Communication Protocols and Transducer Electronic Data Sheet (TEDS) Formats standards committee.

### Introduction

The family code embedded in the lasered ROM number of each 1-Wire device signifies a specific device type. Since each device type has different features and commands, it is imperative the 1-Wire master knows how to translate this family code into the correct commands. Unfortunately, since the family code is only an 8-bit value it is impossible to encode all of the features and commands in it. Instead the 1-Wire master must make this association by different means. One method is to hardcode this association in the source code of the 1-Wire master. It can then be updated by rewriting the source code to accommodate new devices. This method is expensive, and in some cases impossible, thus relegating some 1-Wire masters to only deal with legacy devices.

This document presents a method to dynamically configure the 1-Wire master to correctly communicate with a previously unknown 1-Wire device type by providing the 1-Wire master with a configuration file. The 1-Wire master could be updated with the latest 1-Wire devices by providing a new configuration file. This document describes the format of one such configuration file utilizing XML. This document was originally created to support the IEEE 1451.4 A Smart Transducer Interface for Sensors and Actuators—Mixed-Mode Communication Protocols and Transducer Electronic Data Sheet (TEDS) Formats standards committee.

The appendix proposes a method where a generic family code (for example FD hex) could be differentiated by means of a read-only configuration memory page on the device. No devices currently implement this method.

# **Command Notation**

It is assumed that each 1-Wire master must come with the ability to search for 1-Wire devices and read the unique ROM number associated with each device. The 8-bit family code can be extracted from the ROM number. The 1-Wire master then performs 1-Wire operations as defined by this configuration file based on the 'family-code'. By examining all 1-Wire device operations, a minimum set of commands was derived. The commands are described in **Table 1** along with a suggested notation. **Table 2** describes additional commands that add verification to the command sequences.

Table 1. Core 1-Wire Commands							
Notation	Command Description						
XX	Send the following hex byte value to the 1-Wire bus. If this hex byte is within a cyclic redundancy check (CRC) block then calculate the CRC on the result of the 1-Wire operation (see verification commands).						
{L, delay}	Delay for 'L' milliseconds						
{M}	Select the device with a 1-Wire reset, Match ROM command, and device ROM						
{P}	Prime 1-Wire power delivery (strong pullup) or to occur after the next 1-Wire byte						
{N}	Restore normal pullup						
{U}	Issued a 12-volt pulse (used in erasable programmable read-only memory (EPROM) programming)						
{Ax}	Supply a memory address where 'x' is a number 0,1,representing the least significant byte (LSB) to most significant byte (MSB). For example '{A0}{A1}' would specify a 16-bit address with the least significant byte first, followed by the most significant byte.						
{Dx}	Data to write to a memory device where the 'x' is a number 0,1,representing the LSB to MSB of the data. For example '{D0} {D1} {D2}' is three bytes of data to write. Note the master processing these commands would place the actual data into						

the command flow.{R} Read memory bytes to end of memory. All values read are valid data, however, now verification is performed.

Table 2. Verification Commands						
Notation	Command Description					
{dx}	Data to read. This data can be for verification of data written to a memory 1-Wire device or result data such as a temperature conversion. Note it is in same format as the $\{Dx\}$ command where 'x' is a number indicating the byte number with $\{d0\}$ being the LSB.					
{T}	Success is reading toggling bits such as 0xAA or 0x55.					
{00}	Success is reading all 0's such as 0x00					
{FF}	Success is reading all 1's such as 0xFF					
{CRC16,start,seed}	Start CRC16 calculation by first setting the CRC16 to the provided 'seed' represented in hex notation. All following command bytes are included in the calculation until the 'check' command is found.					
{CRC16,check,value}	Check the CRC16 calculated value to make sure it equals the provided hex 'value'. If it is not then this is a failure. The CRC16 calculation can be stopped after the check.					
{CRC8,start,seed}	Start CRC8 calculation by first setting the CRC8 to the provided 'seed' represented in hex notation. All following command bytes are included in the calculation until the 'check' command is found.					
{CRC16,check,value}	Check the CRC8 calculated value to make sure it equals the provided hex 'value'. If it is not then this is a failure. The CRC8 calculation can be stopped after the check.					

See Figure 1 to see an example command sequence to read the scratchpad of the DS18B20.

#### **Command Sequence**

{M} BE {CRC8,start,0} {d0} {d1} FF FF FF FF FF FF FF {CRC8,check,0x00}

1-Wire Master Translation					
{M}	Send 1-Wire reset, Match ROM command and ROM number				
BE	Send 0xBE (Read ScratchPad) command				
{CRC8,start,0x00}	Initialize the CRC8 to 0, begin CRC8 calculation				
{d0} {d1}	Read the temperature by sending 0xFF 0xFF. Calculate CRC8				
FF FF FF FF FF FF FF	Read rest of scratchpad. Calculate CRC8 on each byte result				
{CRC8,check,0x00}	Check CRC8 value. If it is 0x00 then SUCCESS.				
Figure 1. DS18B20 read temperature command sequence and 1-Wire master translation.					

# Device Types

The general types of 1-Wire devices covered by this document are memory, switch, and temperature. The memory device has some kind of data storage memory area. It can be write-once but must support multiple reads. It is often arranged in pages and is usually written a page at a time. A memory device can have multiple banks of memory with different attributes.

The switch device can control a latch. The latch can connect the output to ground (lowside) or to the communication channel (highside). Some switch devices can also sense voltage. A switch device can have multiple channels.

The temperature device returns a temperature value in Celsius. The result is a signed value representing temperature units. The unit conversion to Celsius is provided.

Each device type contains one or more standard operations. For example each temperature device has a 'read' operation. Table 3 shows the standard operations and attributes of each device type.

Table 3. Device Operations and Attributes by Type						
Device Type	Operations	Attributes				
Memory	Read Write	Read/Write/ReadOnly/WriteOnce Starting Physical Address Number of Pages Page Length in Bytes				
Switch	Read Latch Enable Latch Disable Latch Read Level (optional)	High Side/Low Side				
Temperature	Read	Min Temperature Max Temperature				

#### Step (unit of Celsius returned from Read)

The 'Setup' operation is also included in any of the device type descriptions. A 'Setup' is a command sequence that readies the device for operation. For any of the 'Read' operations there are also two attributes 'AndMask' and 'Polarity'. The 'AndMask' is a hex value that is bitwise anded with the result data described in the command sequence with {d0}. The 'Polarity' indicates that the operation is 'TRUE' if it matches the resulting value from the 'AndMask'. For example when reading the latch state (Read Latch) of a DS2406 channel A, the AndMask = "0x01" and Polarity = "0x00". So the value read from the command sequence is bitwise anded with 0x01 and if the result is 0, the latch is ON.

## **Configuration Format**

The XML syntax was selected for the example configuration file format. Since XML is so 'eXtensible' it was easy to incorporate the device types, operations, attributes, and the actual command sequences into a human readable format. The overall 'tag' for grouping these descriptions was <DeviceDescriptions>. Within this group are individual device descriptions with a specified family code attribute, for example: <Device FamilyCode="0x23">. Each device group can contain <MemoryBank>, <SwitchChannel>, or <TemperatureChannel> groups that correspond to the device types already described. Note that some devices may have more than one channel and group. For example, the DS2406 has both memory and switch groups since it incorporates both of these features. See **Figure 2** for an example XML file describing six different 1-Wire devices. Two of these devices are memory, two are switches, and two are temperature devices.

## Examples

# Appendix

### Memory Configuration Page

The following general memory description describes an idealized memory device with a configuration page that provides all of the necessary information to utilize the remaining memory space. The configuration page could provide the device type differentiation that is currently implemented with the ROM family code but with more information conveyed. A common generic family code (for example FD hex) could be used for all devices with this configuration page.

All 1-Wire memory devices support the Read Memory command (F0 hex), and with the exception of the DS2430A, it requires 2 address bytes. For this example the Read Memory command is used to retrieve the configuration page information at a fixed address of FF7F hex. The memory location has a length byte, 26 bytes of data followed by an inverted CRC16 for validation. Table A1 provides the bit-level details of the configuration page format.

Byte Offset	Name	Conter	nt		
)	Length	Length	of data in the configuration page (fixed at 26)		
		Bit 0	Memory type (1 EEPROM, 0 EEPROM)		
		Bit 1	Scratchpad erased on read-memory (1 YES, 0 NO)		
		Bit 2	Device has read page with CRC16 (1 YES, 0 NO)		
		Bit 3	Device has write-once mode like pseudo EPROM (1 YES, 0 NO) (EEPROM only)		
1	General_Flags	Bit 4	Device has map of used pages (1 YES, 0 NO)		
		Bit 5	Not used 0		
		Bit 6	Not used 0		
		Bit 7	Not used 0		
		Bit 0	Individual page write-protect (1 YES, 0 NO)		
		Bit 1	Global device write-protect (1 YES, 0 NO)		
		Bit 2	Write protect register is organized with one page per bit (1 YES, 0 NO). If not then one page per byte		
2	WriteProt_Flags	Bit 3	Not used 0		
		Bit 4	Not used 0		
		Bit 5	Not used 0		
		Bit 6	Not used 0		
		Bit 7	Not used 0		
	CRC_Flags	Bit 0	Write scratchpad has CRC16 (1 YES, 0 NO)		
		Bit 1	Read scratchpad has CRC16 (1 YES, 0 NO)		
		Bit 2	Read special memory command has CRC16 (1 YES, 0 NO)		
3		Bit 3	Not used 0		
3		Bit 4	Not used 0		
		Bit 5	Not used 0		
		Bit 6	Not used 0		
		Bit 7	Not used 0		
4	Scratchpad_Length	Length	of scratchpad in bytes (EEPROM only)		
5	Page_Length	Length	of normal memory page in bytes		
6	Pages	Numbe	r of pages (2 bytes)		
8	Special_Pages	Numbe	r of special function pages		
9	Special_Page_Length	Length	of special memory page in bytes		
10	ReadScratch_CMD	Read s	cratchpad command		
11	Write_CMD	Write c	ommand (scratchpad for EEPROM)		
12	CopyScratch_CMD	Copy s	cratchpad command		
13	ReadPageCRC_CMC	Read page of memory with CRC16 command			
14	ReadSpecial_CMD	Read s	pecial memory page command		
15	Write_Special_CMD	Write s	pecial memory command		
16	WriteProt_Addr	Addres	s of write-protect registers in special memory (2 bytes)		
18	WriteProtDev_Addr	Addres	s of write-protect entire device register in special memory (2 bytes)		
20	WriteOnce_Addr	Addres	s to write-once mode (pseudo EPROM) flag in special memory (2 bytes)		

22	UsedPgs_Addr	Address in special memory for map of used pages (2 bytes)
24	UsedPgs_Offset	Bit offset of the map of used pages
25	WriteProt_Value	Value written to special memory register to write-protect a page
26	WriteOnce_Value	Value written to special memory register to make a page write-once like pseudo EPROM
27	CRC16	Bitwise inverted CRC16 of bytes 0 to 24, LSB first (2 bytes)

The following table lists the operations described by the configuration page.

Table A2. Operations						
Operation	EEPROM	EPROM	Description			
Read Memory	Х	Х	Read memory with device-generated CRC			
Read Page with CRC	х	х	Read a page of memory with device-generated CRC			
Write Scratchpad	Х		Write the scratchpad in preparation of writing to memory			
Read Scratchpad	Х		Read the scratchpad to verify the write was correct			
Copy Scratchpad	Х		Copy the scratchpad to the final memory location			
Write Memory		Х	Write a byte to memory			
Read Speical Page with CRC		х	Read a page of special memory with device-generated CRC			
Write Special Byte		х	Write a byte to the special memory			
Write Protect Page	х	х	Write-protect a page			
Set Page for Write-Once	х		Set an EEPROM page to be write-once like (pseudo EPROM)			
Calculate Free Pages		х	Calculate the number of free pages in an EPROM device by looking at the map of used pages.			

X supported by all devices of this type

x supported by some devices of this type

<br/>

### **Operations Detail**

The operations detail listed in **Table A2** can be implemented with the details provided by the configuration page. This section provides the sequence and data fields to use to implement the operations.

#### **Read Memory**

- 1-Wire reset and presence
- ROM level command sequence (read/search/match/overdrive match/overdrive skip)
- Write ReadMemory command (F0 hex)
- Write first address byte TA1, LSB
- Write second address byte TA2, MSB
- Read data

#### Read Page with CRC

- If General\_Flags.Bit2 = 1
  - 1-Wire reset and presence
  - ROM level command sequence (read/search/match/overdrive match/overdrive skip)
  - Write ReadPageCRC\_CMD
  - Write first address byte TA1, LSB
  - Write second address byte TA2, MSB
  - Read Page\_Length bytes (unless address is not at page beginning)
  - Read bitwise inverted CRC16

#### Write Scratchpad

- If General\_Flags.Bit0 = 1
  - 1-Wire reset and presence
  - ROM level command sequence (read/search/match/overdrive match/overdrive skip)
  - Write Write\_CMD

- Write first address byte TA1, LSB
- Write second address byte TA2, MSB
- Write data bytes
- If CRCFlags.Bit0 = 1 AND at end of page
  - Read bitwise inverted CRC16

#### Read Scratchpad

- If General\_Flags.Bit0 = 1
  - 1-Wire reset and presence
  - ROM level command sequence (read/search/match/overdrive match/overdrive skip)
  - Write ReadScratch\_CMD
  - Read first address byte TA1, LSB
  - Read second address byte TA2, MSB
  - Read offest and status flags ES
  - Read data bytes
  - If CRCFlags.Bit1 = 1 AND at end of page
    - Read bitwise inverted CRC16

#### Copy Scratchpad

- If General\_Flags.Bit0 = 1
  - 1-Wire reset and presence
  - ROM level command sequence (read/search/match/overdrive match/overdrive skip)
  - Write CopyScratch\_CMD
  - Write first address byte TA1, LSB
  - Write second address byte TA2, MSB
  - Write offset and status flags ES
  - Strong pullup applied to 1-Wire for a minimum of 10ms
  - Read confirmation byte (should be AA or 55)

#### Write Memory

- If General\_Flags.Bit0 = 0
  - 1-Wire reset and presence
  - ROM level command sequence (read/search/match/overdrive match/overdrive skip)
  - Write Write\_CMD
  - Write first address byte TA1, LSB
  - Write second address byte TA2, MSB
  - Write data byte to write
  - Read bitwise inverted CRC16 of command, address, and data (first pass) or address and data (second pass)
  - Apply 480µs 12V programming pulse on the 1-Wire
  - Read confirmation data byte (should OR of old data and current data bytes)
  - If next address to write is sequential then can send the next data byte ....

#### Read Special Page with CRC

- If General\_Flags.Bit2 = 1
  - 1-Wire reset and presence
  - ROM level command sequence (read/search/match/overdrive match/overdrive skip)
  - Write ReadSpecial\_CMD
  - Read first address byte TA1, LSB
  - Read second address byte TA2, MSB
  - Read Special\_Page\_Length bytes (unless address is not at page beginning)
  - Read bitwise inverted CRC16

#### Write Special Byte

- If General\_Flags.Bit0 = 0
  - 1-Wire reset and presence
  - ROM level command sequence (read/search/match/overdrive match/overdrive skip)
  - Write Write\_Special\_CMD
  - Write first address byte TA1, LSB
  - Write second address byte TA2, MSB
  - Write data byte to write
  - Read bitwise inverted CRC16 of command, address, and data (first pass) or address and data (second pass).

- Apply 480µs 12V programming pulse on the 1-Wire
- Read confirmation data byte (should OR of old data and current data bytes)
- If next address to write is sequential then can send the next data byte...

### Write Protect Page

- If WriteProt\_Flags.Bit0 = 1
  - If WriteProt\_Flags.Bit2 = 1
    - Address = WriteProt\_Addr + Page/8
    - Data = WriteProt\_Value Rotate left Remainder (Page/8)
  - Else
    - Address = WriteProt\_Addr + Page
    - Data = WriteProt\_Value
  - Write Special Byte with Address and Data

#### Set Page for Write-Once

- If General\_Flags.Bit3 = 1
  - Address = WriteOnce\_Addr
  - Data = WriteOnce\_Value
  - Write Special Byte with Address and Data

#### Mark Page Used

- If General\_Flags.Bit4 = 1
  - Address = UsedPgs\_Addr + (Page + UsedPgs\_Offset)/8
  - Data = BitInverse (1 Rotate left Remainder ((Page + UsedPgs\_Offest)/8)
  - Write special byte at Address and Data

#### Calculate Free Pages

- If General\_Flags.Bit4 = 1
  - Address = UsedPgs\_Addr
  - Read special page with CRC starting at Address until (Special\_Pages/8) number of bytes read
  - Count the number of 1's in the bytes read, this is the number of free pages

Table A3 provides example configuration pages using existing devices as a template. Note however, these devices do not currently contain the configuration page.

Table	Table A3. Example Configuration Pages								
No. #	Name	Conter	Content		DS2406	DS2505	DS2506	DS2431	DS28E04
0	Length		of data in the ration page	1A	1A	1A	1A	1A	1A
		Bit 0	Memory type (1 EEPROM, 0 EPROM)	1	0	0	0	1	1
		Bit 1	Scratchpad erased on read memory (1 YES, 0 NO)	1	0	0	0	1	1
		Bit 2	Device has read page with CRC16 (1 YES, 0 NO)	0	1	1	1	1	1
1	General_Flags	Bit 3	Device has write-once mode like pseudo EPROM (1 YES, 0	0	0	0	0	1	1

			NO) (EEPROM only)						
		Bit 4	Device has map of used pages (1 YES, 0 NO)	0	1	1	1	0	0
		Bit 5	Not used	0	0	0	0	0	0
		Bit 6	Not used	0	0	0	0	0	0
		Bit 7	Not used	0	0	0	0	0	0
		Bit 0	Individual page write- protect (1 YES, 0 NO)	0	1	1	1	1	1
		Bit 1	Global device write- protect (1 YES, 0 NO)	0	0	0	0	0	0
2	WriteProt_Flags	Bit 2	Write- protect register is organized with one page per bit (1 YES, 0 NO). If no then is one page per byte.	0	1	1	1	0	0
		Bit 3	Not used	0	0	0	0	0	0
		Bit 4	Not used	0	0	0	0	0	0
		Bit 5	Not used	0	0	0	0	0	0
		Bit 6	Not used	0	0	0	0	0	0
		Bit 7	Not used	0	0	0	0	0	0
		Bit 0	Write scratchpad has CRC16 (1 YES, 0 NO)	1	0	0	0	1	1
	CRC_Flags	Bit 1	Read scratchpad has CRC16 (1 YES, 0 NO)	0	0	0	0	1	1
3		Bit 2	Read special memory command has CRC16 (1 YES, 0 NO)	0	1	1	1	0	0
		Bit 3	Not used	0	0	0	0	0	0

		Bit 4	Not used	0	0	0	0	0	0
		Bit 5	Not used	0	0	0	0	0	0
		Bit 6	Not used	0	0	0	0	0	0
		Bit 7	Not used	0	0	0	0	0	0
4	Scratchpad_Length		of scratchpad (EEPROM	20	00	00	00	08	20
5	Page_Length	0	of normal v page in	20	20	20	20	20	20
6	Pages	Number	of pages	10 00	04 00	40 00	00 01	04 00	10 00
8	Special_Pages	Number function	of special pages	00	01	0B	0B	01	02
9	Special_Page_Length	0	of special v page in	00	08	08	08	08	20
10	ReadScratch_CMD	Read so	cratchpad nd	AA	00	00	00	AA	AA
11	Write_CMD		ommand apad for M)	0F	0F	0F	0F	0F	0F
12	CopyScratch_CMD	Copy so comma	cratchpad nd	55	00	00	00	55	55
13	ReadPageCRC_CMD	Read p memory comma	with CRC16	00	A5	A5	A5	00	00
14	ReadSpecial_CMD	Read s memory comma	/ page	00	AA	AA	AA	F0	F0
15	Write_Special_CMD	Write sp memory	pecial command	00	55	55	55	0F	0F
16	WriteProt_Addr	protect	s of write- registers in memory (2	00 00	00 00	00 00	00 00	80 00	00 20
18	WriteProtDev_Addr	protect register	s of write- entire device in special v (2 bytes)	00 00	00 00	00 00	00 00	00 00	00 00
20	WriteOnce_Addr	once m EPROM	s to write- ode (pseudo 1) flag in memory (2	00 00	00 00	00 00	00 00	80 00	00 20
22	UsedPgs_Addr	memory	s in special / for map of ages (2 bytes)	00 00	00 00	40 00	40 00	00 00	00 00
24	UsedPgs_Offset	Bit offse of used	et of the map pages	00	04	00	00	00	00
25	WriteProt_Value	special	vritten to memory to write- a page	00	00	00	00	55	55
26	WriteOnce_Value	special	vritten to memory to make a	00	00	00	00	AA	AA

		page write-once like pseudo EPROM						
27	CRC16	Bitwise inverted CRC16 of bytes 0 to 24, LSB first (2 bytes)	XX XX	xx xx	xx xx	xx xx	XX XX	XX XX

X single numbers are binary (0 or 1)

XX double numbers are in hex

The DS2506, DS2409, and DS2430A are no longer recommended for new designs.
